A gene fusion (T38249) comprises coding sequences for the Yersinia pestis F1 antigen (see also T38248) including the signal sequence and for the Y. pestis V antigen (see also T38243), joined by a sequence encoding a 6-amino acid peptide linker. It was obtd. by CR amplification of the individual genes using primers (see also T38245) based on the genes and including linker sequences. The gene fusion (see also T38256) can be used to produce F1/V fusion protein (W01044) in transformed cells, esp. gut-colonising corganisms, to induce an immune response against Y. pestis, the causative organism of plague.

C A gene fusion (T38256) comprises coding sequences for the versinia pestis F1 antigen (see also T38244) (without the signal sequence) and for the Y. pestis V antigen (see also T38243), joined by a sequence encoding a 6-amino acid peptide linker. It was obtd. by PCR amplification of the individual genes using primers (see also T38245) based on the genes and including linker sequences. The gene fusion (see also T38249) can be used to produce FI/V fusion protein (W01045) in transformed cells, esp. gut-colonising organisms, to induce an immune response against Y. pestis, the causative organism of plague.

                                                                                                                                                                                                                                                                Recombinant DNA expressing versinia pestis V antigen - useful in recombinant DNA expressing versinia pestis V antigen - useful in radial or parenteral vaccines for protection against plague set lain 6; Page 11-13; 25pp; English.

Claim 6; Page 11-13; 25pp; English.

Crant of the mature V protein of Versinia pestis. The protein was a fusion protein with maltose binding protein or versinia pertice. The protein or versinia pertice in a different plasmid vectors. Y. pestis is glutathione- S-transferase in 3 different plasmid vectors. Y. pestis is the highly virulent causative organism of plague in a wide range of animals, including man. The V antigen (LcrV) is an unstable 37.3 kba monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen is postulated to act as a virulence antigen, and transformed microorganisms contg. recombinant DNA encoding a V antigen protein/ peptide are useful in vaccines to protect against plague.

PT Yersinia pestis V antigen and F1 antigen or their protective PT epitopic parts - useful in vaccine for protection against plague PS Claim 5; Page 25-28; 98pp; English.

CA lorV gene sequence (T38242) codes for the Yersinia pestis V CC antigen (W01040), which is capable of evoking protective immune CC responses in animals. The gene was amplified from V, pestis CC DNA, by PCR using primers (T38250-51) homologous to the 5' and 3' CC ends of the gene. The gene was inserted into vector pMAL-p2, CC pMAL-c2 or pGEX-5x-2 (see also T38244) to allow prodn. of CC recombinant V antigen for use in vaccines against plague.

CE Expression in gut-colonising organisms and attenuated Salmonella CC typhi allows prodn. of live vaccines. F1/V antigen fusions were calso created (see also T38249 and T38256). The gene can itself be considered to vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

19 Yersinia pestis V antigen and F1 antigen or their protective epitopic parts - useful in vaccine for protection against plague of the person sequence (T38243) codes for the Yersinia pestis V antigen (W01041), which is capable of evoking protective immune reponses in animals. The gene was amplified from Y. pestis capable of evoking protective immune reponses in animals. The gene was amplified from Y. pestis of the yer was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis of the yer was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses reponses in animals. The gene was amplified from Y. pestis reponses in animals. The gene was amplified from Y. pestis reponses reponses

PT Recombinant DNA expressing Yersinia pesus.

PT Recombinant DNA expressing Yersinia pesus.

PT Recombinant DNA expressing Yersinia pesus.

PT oral or parenteral vaccines for protection against plague

PS Claim 6; Page 15-16; 25pp; English.

CC T04222-23 are DNA sequences (lcrV) encoding all or a protective epitopic

CC part of the mature V protein of Yersinia pestis. The protein was

CC expressed as a fusion protein with maltose binding protein or

CC glutathione- S-transferase in 3 different plasmid vectors. Y. pestis

CC is the highly virulent causative organism of plague in a wide range of

CC monomeric peptide encoded on the ca. 70 kb Lcr plasmid. The V antigen

CC is postulated to act as a virulence antigen, and transformed

CC minals contg. recombinant DNA encoding a V antigen protein/

neptide are useful in vaccines to protect against plague.

Disclosure; Page 19-20; 27pp; English. The sequence represents the plasmid pFORFIb including the entire Y. pestis cafl (FI) antigen gene having a 5' tail incliding a SacI restriction site, and up to TATAG downstream of the cafl ORF. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection against infection with Y. pestis, and are parenterally and orally active vaccines offering protection against bubonic and pneumonic

A DNA sequence (T38248) comprises the cafl gene, including the signal sequence, coding for the F1 antigen (W01043) of Yersinia pestis. It was obtd. by PCR amplification (see also T38257-58) of Y. pestis DNA. The PCR product was cloned into plasmid pBKCMV and the resulting plasmid (pF1AB) was used to transform E. coli No Blue. Purified plasmid, when administered by i.m. injection, induced an immunoglobulin response to F1 in BALB/C mice. Live vaccines comprising gut colonising organisms transformed with the cafl gene (see also T38244) can be used to protect a host animal

This is the nucleotide sequence of a Yersinia pestis F1 antigen, u in the method of the invention. Plasmid and host cells are used to produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable protecting an animal from contracting plague.

This is the nucleotide sequence of a Yersinia pestis Fl antigen, us in the method of the invention. Plasmid and host cells are used to produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable opituceting an animal from contracting plague.

This is the nucleotide sequence of a Yersinia pestis F1 antigen, used in the method of the invention. Plasmid and host cells are used to produce recombinant antigens, especially Yersinia pestis antigens. The recombinant antigens can be used in vaccines that are capable of protecting an animal from contracting plague.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used as live or attenuated vaccines which induce an immune response, against yersinia pestis, at mucosal surfaces. Claim 7; Page 15-16; 27pp; English.
The sequence represents the plasmid pFGAL2a construct showing the fusion of the first few bases of beta-galactosidase in the vector with the Y. pestis cafl (F1) antigen minus its signal sequence and having a 5' tail including a SacI restriction site, and up to the cafl AACC-3' end with some vector bases. The DNA construct can be used to transform human or animal gut colonizing microorganisms, specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection against infection with Y. pestis, and against bubonic and pneumonic plague.

The caf1 gene (T38244) codes for the Yersinia pestis F1 antigen (W01042), which is capable of evoking protective immune responses in animals. The gene was amplified from Y. pestis DNA by PCR using primers (T38245-46) homologous to the 5' and 3' ends of the gene. The caf1 PCR product was ligated into pUC18 and transformed into E. coli JM109 to produce vector pFGAL2a. The caf1 gene can be used to produce recombinant F1 antigen for use in vaccines against plague.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expression in gut-colonising organisms and attenuated Salmonelia typhi allows prodn. of live vaccines. The gene can itself be used in genetic vaccines. F1/V antigen fusions were also created (see also T38249 and T38256).

Disclosure; Page 17-18; 27pp; English.

The sequence represents the plasmid pFSIG3a construct showing the fusion of the first few bases of the E. coli LTB signal sequence with the Y. pestis cafl (FI) antigen minus its signal sequence and having a 5' tail including a SacI restriction site, and up to the cafl AACC-3' end with some vector bases. The DNA construct can be specifically attenuated Salmonella typhimurium or Salmonella typhi. The transformed microorganisms can be used as live/attenuated vaccines which induce immune responses at mucosal surfaces. The vaccines provide protection against infection with Y. pestis, and against bubonic and pneumonic plague.
